## Cedar Shingle Roof Information and Maintenance Guide

Our Western Red Cedar Shingles have a universal appeal, an excellent choice for your building and extremely popular around the world especially in Europe and Australasia.

Our Western Red Cedar Shingles are sawn from highest quality of British Columbian Cedar logs, providing a warm and rich amber toned aesthetic to the roof. Our shingles are sawn on both sides making them thinner therefore the taper is less obvious, giving a more smooth and uniform finish. Western Red Cedar Shingles are perfect if you are looking for a more general-purpose style of roofing. If you wish to create more of a rustic look then we suggest choosing this option for your building.

Using Western Red Cedar timber as a roofing material comes with many advantages. Not only is it a naturally occurring and eco-friendly material, but cedar wood is also renowned for its stable, durable, and lightweight qualities. On top of that, you will not have to worry about extra heating costs as Cedar shingles have been proven to be extremely insulant. All of that, paired with the stunning aesthetic that our Western Red Cedar Shingles give to the roof can only mean that you are on to a winner.

**N.B. When Western Red Cedar is left untreated it will weather and change colour to a silver grey, this can happen quite quickly especially with high exposure to UV light. In the UK, the moist climate can cause the weathering process to happen unevenly, dark grey patches will appear, and the rest of the timber will follow eventually. It is evident when the cedar has not been treated.**
